

OCF PO4FIX – Procedures

STEP 1 – PREPARATION

1. Verify:
 - a. Vent lines are not plugged.
 - b. Cooler tubes are not plugged.
 - c. The flush must be able to flow throughout the system.
2. Materials needed:
 - a. Enough **OCF** to fill the entire cooling system.
 - b. Enough **PO4FIX** to fill the cooling system COMPLETELY.
 - c. **PO4FIX** is ready to use and should never be diluted.
 - d. Enough **DEIONIZED** water to fill entire system THREE TIMES.
 - e. Two X 1" ball valves, one installed on each side of block underneath rail.
 - f. Empty totes available to drain flush if needed.
 - g. Have new thermostats ready to install if needed.
 - h. Have new water pump ready to install if needed.
3. Record water pump pressure and all temps.

STEP 2 – DRAIN COOLANT & DISPOSE

1. Shutdown, LOTO, and Remove Surge/Day Tank Cap.
2. Drain and dispose of old coolant.
3. Install ball valves. (leave open)

STEP 3 – FILL WITH OCF

1. With Surge/Day Tank Cap removed, fill SLOWLY with **OCF** until overflow from Surge/Day Tank.
2. Record how much **OCF** is used to completely fill cooling system.
3. Replace Surge/Day Tank Cap.

STEP 4 – RUN AT FULL LOAD

1. Run Unit 168 hours (one week) to 336 hours (two weeks) at full load.
2. Record water pump pressure and all temps daily.

STEP 5 – RINSE SURGE/DAY TANK

1. Record water pump pressure and all temps.
2. Shutdown, LOTO, and Remove Surge/Day Tank Cap.
3. While still HOT and FULL, Power wash Surge Tank with **STH - Surge Tank Hose**.
4. Let particles overflow until water runs clear. (@15-20 min)

STEP 6 – DRAIN FLUSH & DISPOSE

1. With Surge/Day Tank Cap removed, drain Flush via ball valve on each side of block underneath rail. (dispose as you would old coolant)

STEP 7 – FILL WITH PO4FIX

1. With Surge/Day Tank Cap removed, fill SLOWLY with **PO4FIX** (Ready to Use) until overflow from Surge/Day Tank.
2. Record how much **PO4FIX** is used to completely fill cooling system.
3. Replace Surge/Day Tank Cap.

STEP 8 – RUN AT FULL LOAD

1. Run Unit **4** hours, at temp, at full load.
2. Record water pump pressure and all temps.

STEP 9 – RINSE SURGE/DAY TANK

1. Record water pump pressure and all temps.
2. Shutdown, LOTO, and Remove Surge/Day Tank Cap.
3. While still HOT and FULL, Power wash Surge Tank with [STH - Surge Tank Hose](#).
4. Let particles overflow until water runs clear. (@15-20 min)

STEP 10 – DRAIN FLUSH & DISPOSE

1. With Surge/Day Tank Cap removed, drain Flush via ball valve on each side of block underneath rail. (dispose as you would old coolant)

STEP 11 – RINSE OUT ALL PARTICULATES

1. Fill SLOWLY with deionized water until overflow from Surge/Day Tank.
2. Run Unit until up to temp and thermostats open.
3. Continue to pump in deionized water (2 x volume) until overflowing from the top at the Surge/Day Tank and ball valve on other side until clean.

STEP 12 – DRAIN & DISPOSE

1. Shutdown/LOTO/Remove
2. With Surge/Day Tank Cap removed, drain and dispose of rinse water.

STEP 13 – INSPECTION

1. Inspect water pump and thermostats and replace if needed.

STEP 14 – FILL WITH COOLANT

1. NEVER LEAVE OR RUN WITH WATER ONLY!
2. Fill with 50/50 coolant mix to winterize
3. Fill with [CoolAint](#) to Summerize

STEP 15 – REMEMBER

1. Quarterly coolant sampling.
